A comprehensive review of previously published data has been completed.: Yes
The specific aims are clear and focused.: Yes
The investigator has appropriate experience and expertise to develop the concept proposal; if not, has identified a mentor or senior co-investigator.: Yes
The investigator agrees to develop an initial draft of the concept proposal within 6 weeks of approval of the AOI and to finalize the concept proposal within 6 months.: Yes

Project Title: The Impact of the Sibling Sociodemographic and Health Factors on Psychological Outcomes of Childhood Cancer Survivors

Planned research population (eligibility criteria): The proposed analyses will utilize data which was collected between 1994 and 1998 via a 24-page self-report baseline questionnaire. We will utilize data collected from healthy adult (greater than or equal to 18 years of age at time of responding to baseline questionnaire) siblings of childhood cancer survivors (n = 3,899) and their matched survivors. Of the participating siblings, these analyses will utilize those who were > 18 years of age at the time of completion of the baseline questionnaire resulting in data from 3,083 siblings (and their respective survivors).

Proposed specific aims: Aim 1: To identify the predictors of psychological distress among adult survivor of childhood cancer with a focus on siblings’ sociodemographic factors, current physical, and mental health status in a cohort of siblings and matched survivors. Hypothesis 1: Siblings factors including marital status (i.e., being married), employment status (i.e., being employed), parental status (i.e. being a parent), family structure (i.e., multiple siblings in family), poor health status (i.e., self-reported adverse health, presence of chronic health conditions) and poor mental health status (i.e., psychological distress as measured by the BSI-18) will be associated with increased psychological distress as measured by the BSI-18 among survivors of childhood cancer. Aim 2: To identify the predictors of psychological distress among adult survivor of childhood cancer with a focus on siblings’ age, gender, and residence in relation to the age, gender, and residence of their matched survivors. Hypothesis 2: Sibling gender in relation to their survivor gender (i.e., female sibling and female survivor), sibling age in relation to their survivor age (i.e., sibling younger and survivor older), and sibling residence in relation to
their survivor (i.e., both sibling and survivor living with parents) will be associated with decreased psychological distress as measured by the BSI-18 among survivors of childhood cancer.

Will the project require non-CCSS funding to complete?: No
If yes, what would be the anticipated source(s) and timeline(s) for securing funding?:

Does this project require contact of CCSS study subjects for . . .

Additional self-reported information: No
Biological Samples: No
Medical record data: No
If yes to any of the above, please briefly describe.: 

What CCSS Working Group(s) would likely be involved? (Check all that apply)

Second Malignancy:
Chronic Disease:
Psychology / Neuropsychology: Primary
Genetics:
Cancer Control:
Epidemiology / Biostatistics:

To describe the anticipated scope of the study, please indicate the specific CCSS data to be included as outcome (primary or secondary) or correlative factors. (Check all that apply)

Late mortality:
Second Malignancy:

Health Behaviors

Tobacco:
Alcohol:
Physical activity:
Medical screening:
Other:
If other, please specify:

Psychosocial

Insurance:
Marriage: Correlative Factors
Education:
Employment: Correlative Factors
Other:
If other, please specify: The main effect variables to be assessed include sibling marital status,
Medical conditions
